MAX. Power 15W Isolated On-Board Type AC-DC Converter

HS15 Series Isolated On-Board Type AC-DC Converter

Features

- Power Saving Mode Operation
- High Efficiency
- Isolated Input – Output
- 100kHz fixed frequency and Current mode Control
- Low output Ripple & Noise
- Built-in over current protection circuit
- Short Circuit Protection
- Universal Input Voltage(Free Voltage)
- Safety standard : CB, CE approved
- RoHS compatible design

Applications

- Data and telecommunication
- FA control
- Datacommunication electronic equipments

Environment

- Operating Temperature : -10℃ ~ 70℃
- Operating Humidity : 20% ~ 90% RH (Non condensing)
- Storage Temperature : -20℃ ~ 75℃
- Cooling : Free-Air Convection
- MTBF : 4.0×10^5 hrs

Model Name Structure

- Reliability Data

1. MTBF

Calculating Reliable Values of MTBF

Calculated based on part count reliability projection of MIL-HDBK-217F individual failure rates λg is given to each part and MTBF is calculated by the count of each part.

Method is :

$$MTBF = \frac{10^6}{\sum_{i=1}^{i=n} Ni(\lambda g \cdot \pi Q)i} = \frac{10^6}{\lambda\ equip} \quad \text{[hours]}$$

For a given equipment environment where :

$\lambda\ equip$ = Total equipment failure rate (Failures / 10^6 Hours)

λg = Generic failure rate for the i th generic part (Failures / 10^6 Hours)

πQ = Quality factor for the i th generic part (πQ= 1)

Ni = Quanty of i th generic part

n = Number of different generic part categories in the equipment

The shortest lifetime parts is an electrolytic capacitor. Thus, the lifetime of SMPS is lifetime of electrolytic capacitors.

Lifetime of electrolytic capacitor can be calculated by the following factors.

- T_0 : Load life rating
- T_{max} : Maximum temperature rating of capacitor
- T_{case} : Temperature of case

$$T[hour] = T_0 * 2^{\frac{T_{max} - T_{case}}{10}}$$

T : Life Time(Electrolytic Cap.)
T_0 : Load Life Rating
T_{max} : Max. Tepmerature rating of capacitor
T_{case} : Temperature of case

3. Environmental Stress Test(EST)

The purpose of the environment stress test is to ensure reliability by setting in advance the following environment and verified.

- transport process and conservation status
- environmental change conditions that can be applied to the product from the process of the end-user

Test cycle consists of 10 segments(total 100 hours). Test results of all segments must meet the specifications. (refer to Fig.1 & Table1)

< Fig.1 : Test Cycle >

Segment	Time	Temp.	Humidity	Description	Input 'SW'

5. Derating of Semiconductor

Compare Tjmax(maximum junction temperature) and TJ and is expressed as a percentage. Tj is the value calculated by the temperature of the case and the power dissipation and the thermal impedance.

- Measuring Components : Bridge Diode, FET, Rectifier diode
- Calculating method of derating ratio

$$\text{Derating Ratio} = \frac{Tj}{Tj(max)} \times 100\ [\%]$$

$$T_j = T_c + (R_{\Theta(J\text{-}C)} \times P_d)$$

T_c : Case Temperature

$R_{\Theta(J\text{-}C)}$: Thermal impedance between junction and case

P_d : Power dissipation

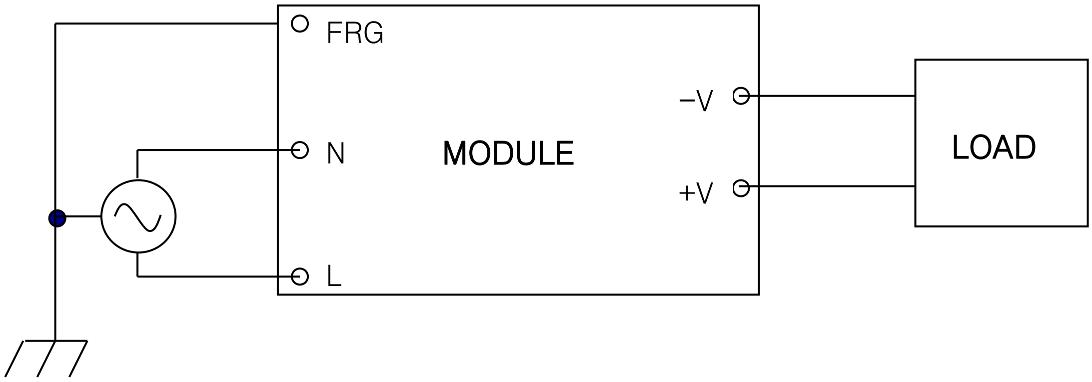
- Application Sheet

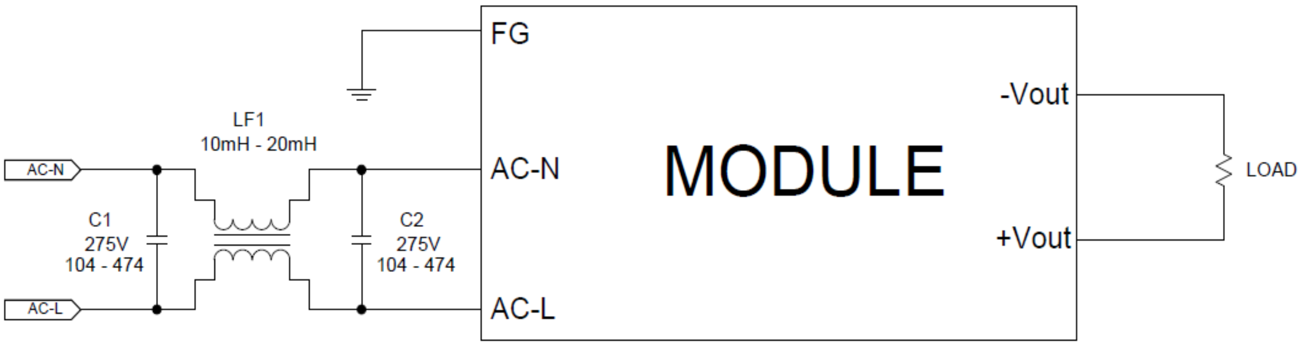
1. Basic Connection



AC INPUT : 90Vac ~ 264Vac (Free Voltage)

※ For safety and improved noise, ensure secure connection of the FRG Pin to the ground terminal of the equiptment.
※ To avoid excessive voltage drop and improved noise, short and thick wire should be used to connect the load.

2. EMI(Electro Magnetic Interference) Connection



C1, C2	Y-Cap. AC 250V ~ 400V / 1000pF ~ 2200pF
LF1	Common mode line filter 10mH ~ 20mH

3. Input Section

Input Fuse

Generally, ac-dc converter(HS Series) has internal fuse. Refer to Fuse Rating table. Avoid using fast-blow fuse.

< Fuse Rating table > Type : SS5, Time-Lag

	HS10	HS15
Fuse	1.6A	1.6A

UL/CSA or IEC approved type should be used to meet safety requirements.

4. Output Section

Output Ripple and Noise Measurement Method

The measurement for output ripple and noise are based on normal probe with 20㎒ bandwidth scope. Upon measurement of the ripple voltage, make sure that the scope probe leads are not too long. If a precise measurement can be made, the noise occurs from circumference must be reduced.

Regulation

Line Regulation

The line regulation means to the change in output voltage when the input voltage is varied within the input voltage range, at constant load and constant ambient temperature. The measurement point for the output voltage are ±Vout pins respectively.

Load Regulation

The load regulation means to the change in output voltage when the load is changed from minimum load to maximum load, at constant input voltage and constant ambient temperature. The measurement point for the output voltage are ±Vout pins respectively.

5. Protection

Over Current Protection

The HS series is built into an OCP(Over Current Protection) circuit. When the OCP triggers, the output voltage will fall. If overload condition is removed, the output will automatically recover.

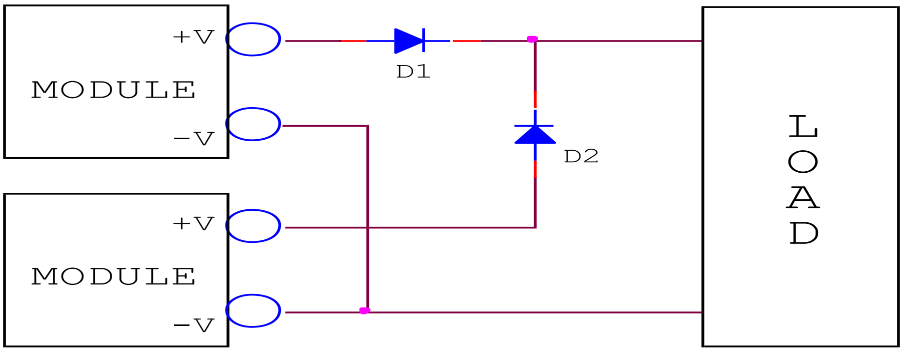
Short Circuit Protection

The HS series is built into an short circuit protection circuit. It is similar to OCP circuit. When output is short condition, the output voltage will fall. If short condition is removed, the output will automatically recover. However, if the short condition continues damage to the module could occur.

6. Operation Method

Parallel Operation

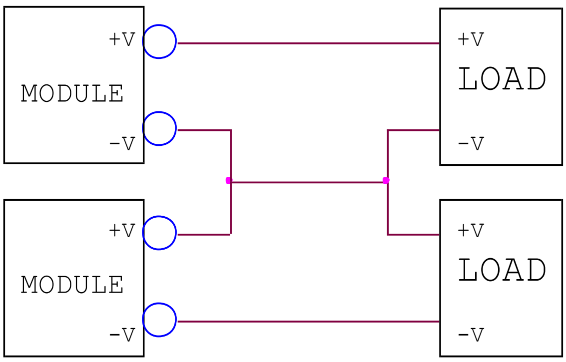
The module can be operated parallel connection. Refer to diagram as shown below.



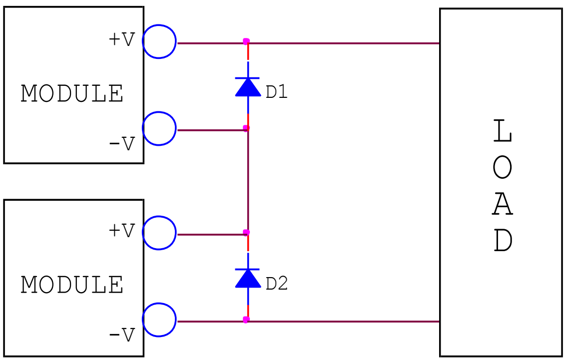
Please, you must consider both revers voltage and forward current of diode, when you choose a diode.
Maximum reverse voltage(Vrm) : Vrm > 1.5 X Vo
Forward current(If) : If > 3 X Io
Also, design a heatsink according to power loss at diode. If you want to reduce power loss, use a schottky barrer diode.
Power loss = Vf(forward voltage) X Io(output current)

Series Operation

Series operation is available by connecting the outputs of two or more module as shown below.



< A. General Series Operation >



< B. Complemental Series Operation >

Please, you must consider both revers voltage and forward current of diode, when you choose a diode.

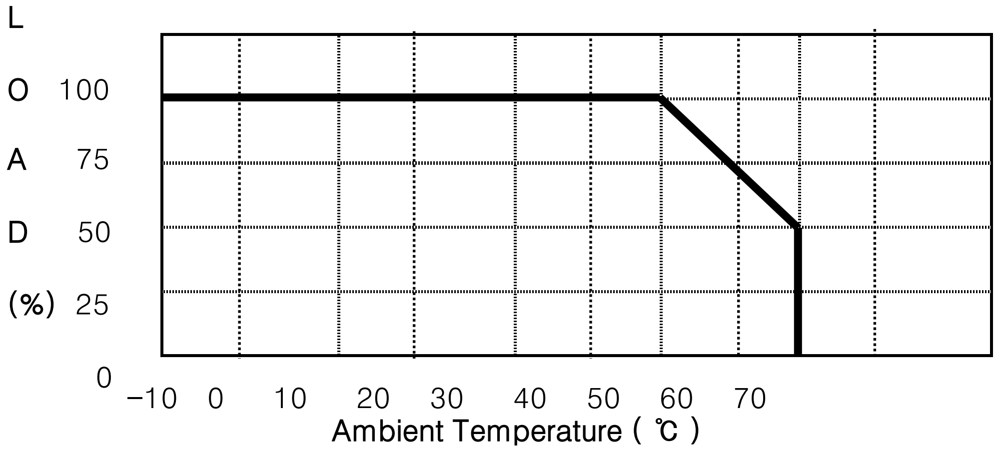
7. Environment

Temperature

Operation Temperature

The range of ambient temperature in ℃ over which a module can be operated safely at either rated or derated output power. Refer to derating curve as shown below.



※ Operating Temperature Range : From -10℃ to 70℃

< Derating Curve>

Storage Temperature

The range of ambient temperature in ℃ over which a module may be stored long term without damage. The storage temperature range is from -20℃ to 75℃.

Humidity

Operation Humidity

The range of ambient humidity in % over which a module can be operated safely at either rated or derated output power. Refer to derating curve as shown below. The operating humidity range is from 20% to 90%RH.

Storage Humidity

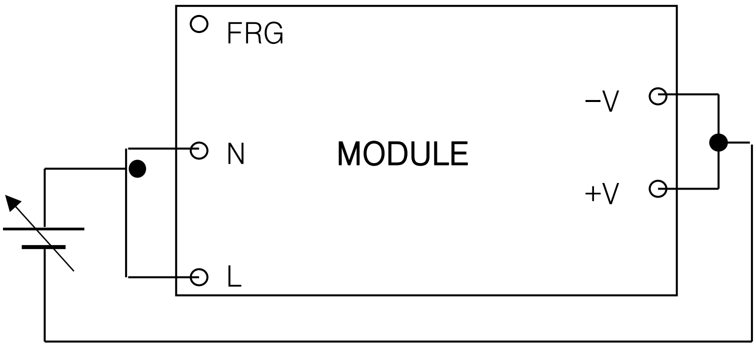
The range of ambient humidity in % over which a module may be stored long term without damage. The storage humidity range is from 20% to 90%RH.

8. Isolation

Isolation Resistance

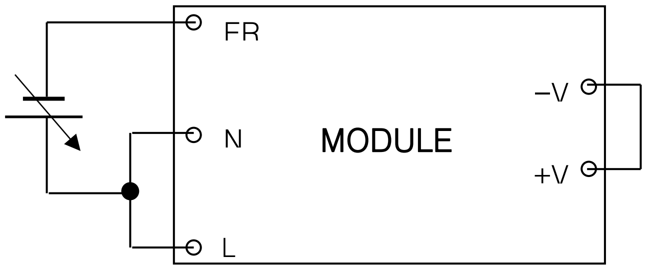
The electrical separation between input and output of a module by means of the power transformer. The isolation resistance is a function of materials and spacings employed throughout the module. Please don't test with a voltage above standard voltage for the Isolation Resistance Test.

< INPUT - OUTPUT>



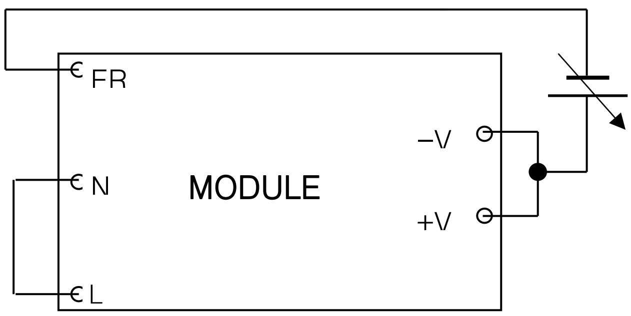
500VDC, 100MΩ

<INPUT - FRG>



500VDC, 100MΩ

< OUTPUT - FRG>

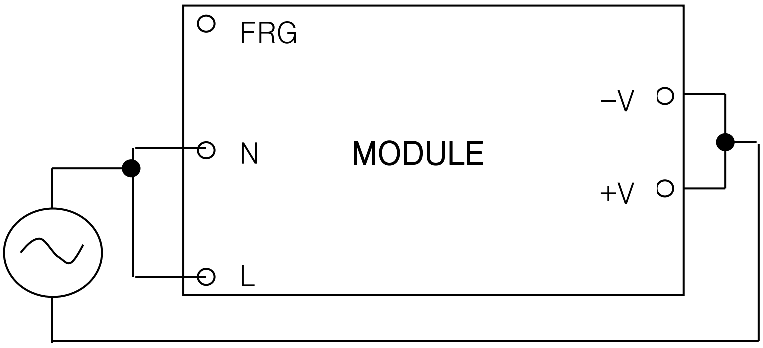


500VDC, 70MΩ

Withstand Voltage

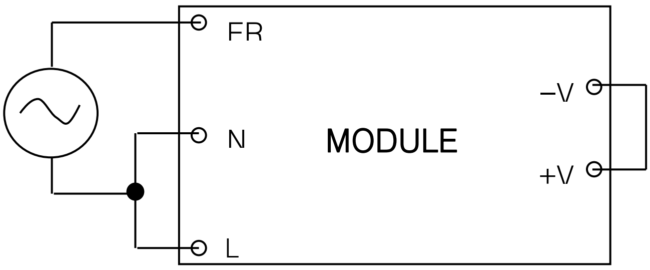
For the withstand voltage test, the applied voltage must be increased gradually from zero to the testing value, and then decreased gradually at shut down. Especially stay away from use of a timer. Where a pulse of several times the applied voltage can be generated.

< INPUT - OUTPUT>



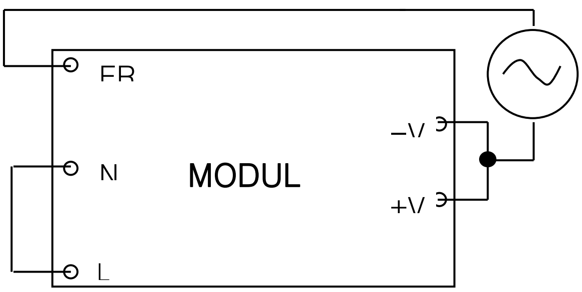
3kVAC (10mA) 1minute

<INPUT - FRG>



2kVAC (10mA) 1minute

< OUTPUT - FRG>



0.5kVAC (10mA) 1minute
