

# SIDAC

(95 - 330 Volts)

## General Description

The Sidac is a silicon bilateral voltage triggered switch with greater power-handling capabilities than standard diacs. Upon application of a voltage exceeding the Sidac breakover voltage point, the Sidac switches on through a negative resistance region to a low on-state voltage. Conduction will continue until the current is interrupted or drops below the minimum holding current of the device.

Teccor offers the complete voltage range (95-330) over three different packages:

- TO-92 (95-280 volts)
- Axial lead DO-15X (95-280 volts)
- Surface Mount DO-214AA (95-280 volts)
- TO-202AB (190-330 volts)

Teccor's Sidacs feature glass passivated junctions to ensure a rugged and dependable device capable of withstanding harsh environments.

Variations of devices covered in this data sheet are available for custom design applications. Please consult the factory for more information.

## Applications

- High voltage lamp ignitors
- Natural gas ignitors
- Gas oil ignitors
- High voltage power supplies
- Xenon ignitors
- Over voltage protector
- Pulse generators
- Fluorescent lighting ignitors
- HID lighting ignitors

## Features

- AC circuit oriented
- Glass-passivated junctions
- High surge current capability

## General Notes

- All measurements are made at 60Hz with a resistive load at an ambient temperature of  $+25^\circ\text{C}$  unless otherwise specified.
- Storage temperature range ( $T_S$ ) is  $-65^\circ\text{C}$  to  $+150^\circ\text{C}$ .
- The case ( $T_C$ ) or lead ( $T_L$ ) temperature is measured as shown on the dimensional outline drawings. See "Package Dimensions" section of this catalog.
- Junction temperature range ( $T_J$ ) is  $-40^\circ\text{C}$  to  $+125^\circ\text{C}$ .
- Lead solder temperature is a maximum of  $+230^\circ\text{C}$  for 10 seconds maximum;  $\geq 1/16"$  (1.59mm) from case.

## Electrical Specification Notes

- See Figure 9.6 for  $V_{BO}$  change vs junction temperature.
- See Figure 9.7 for  $I_{BO}$  vs junction temperature.
- See Figure 9.2 for  $I_H$  vs case temperature.
- See Figure 9.14 for test circuit.
- See Figure 9.1 for more than one full cycle rating.
- $R_{\theta JA}$  for TO-202 Type 23 and Type 41 is  $70^\circ\text{C}/\text{watt}$ .
- $T_C \leq 90^\circ\text{C}$  for TO-92 Sidac and  $T_C \leq 105^\circ\text{C}$  for TO-202 Sidacs.  $T_L \leq 100^\circ\text{C}$  for DO-15X and  $T_L \leq 90^\circ\text{C}$  for DO-214AA.
- See Figure 9.15 for clarification of Sidac operation.
- For best Sidac operation, the load impedance should be near or less than switching resistance.
- Teccor's new, improved series of sidacs is designed to ensure good commutation at higher switching frequencies as required in ignitor circuits for high intensity discharge (HID) lighting. A typical circuit for a metal halide lamp ignitor is shown in the schematic, Figure 9.3. With proper component selection this circuit will produce three pulses for ignition of Osram lamp types such as HQI-T70W, HQI-T150W, and HQI-T250W which require a minimum of three pulses at 4kV magnitude and  $>1\mu\text{s}$  duration each at a minimum repetition rate of 3.3kHz.
